## 1 Introduction

- **Objective of the Project:** The goal of this project is to design and develop a role-based Hospital Management System (HMS) that supports secure login, doctor availability, appointment management, and treatment history through a unified web interface.
- **Motivation:** Many mid- and small-scale hospitals rely on manual scheduling and paper-based patient history, leading to double bookings and information loss. HMS provides centralized appointment allocation and reliable medical record tracking.
- **Web Applications in Healthcare:** Role-based web systems allow patients, doctors, and hospital staff to access the same database through permission-controlled dashboards, improving transparency and reducing administrative overhead.

## 2 System Overview

### 2.1 Features Implemented

- **Role-Based Access Control:**
  - **Admin:** Manages doctors, patients, and all appointments. Dashboard shown in Figure 7.
  - **Doctor:** Views upcoming appointments, manages availability, and records treatment (Figure 5).
  - **Patient:** Registers, books appointments, views history (Figure 3).
- **Authentication and Redirection:** A unified login page routes users to their respective dashboards based on role (Figure 2).
- **Admin Functionalities:** Add/update/blacklist doctors, manage patients, and view *all appointments* (Figure 8).
- **Doctor Functionalities:** View appointments and record treatment using a structured form (Figure 6).
- **Patient Functionalities:** Find doctors and book appointments within allowed availability windows (Figure 4).

### 2.2 Technology Stack

Technology	Role in Project
Flask	Backend routing and business logic
SQLite	Relational database for persistent storage
Jinja2	Server-side template rendering
Bootstrap	Responsive page layout and styling
Werkzeug Security	Password hashing and authentication safety

### 3 Architecture

#### 3.1 Directory Structure

```

hospital_app/
  app.py
  models/
    models.py
  controllers/
    routes.py
  templates/
    base.html
    login.html
    dashboard_admin.html
    dashboard_doctor.html
    dashboard_patient.html
    admin_appointments.html
    patient_book_appointment.html
    doctor_treatment_form.html
  instance/hospital.db
  static/ (CSS/JS)

```

#### 3.2 ER Diagram

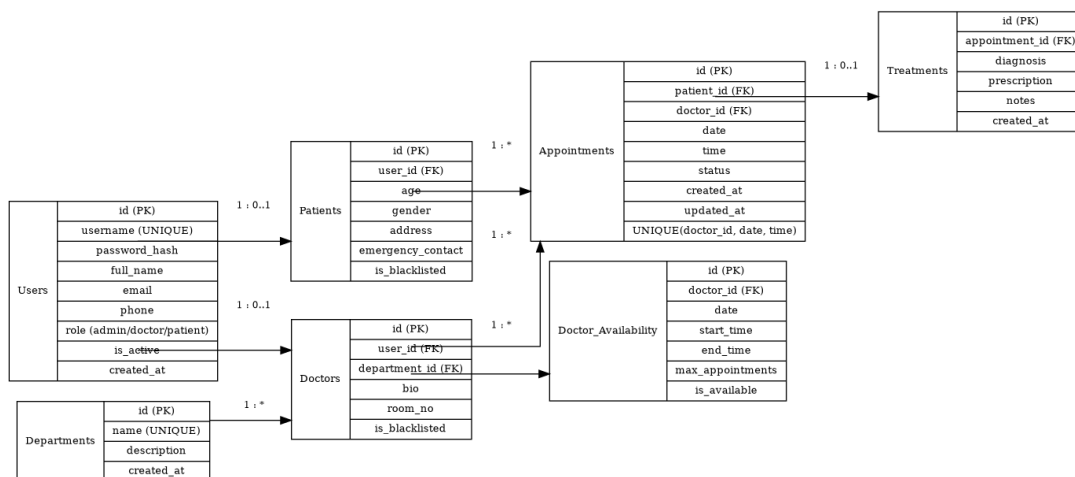

Figure 1: Entity Relationship Diagram of the Hospital Management System.

### 4 User Interface Screens

This section highlights the most important user flows of the Hospital Management System (HMS). Each interface has been designed using HTML, Bootstrap, and Jinja2 to provide a clean and role-specific experience.

## 4.1 Login and Registration

The system begins with a unified login interface for all roles. Patients can also register themselves from this screen.

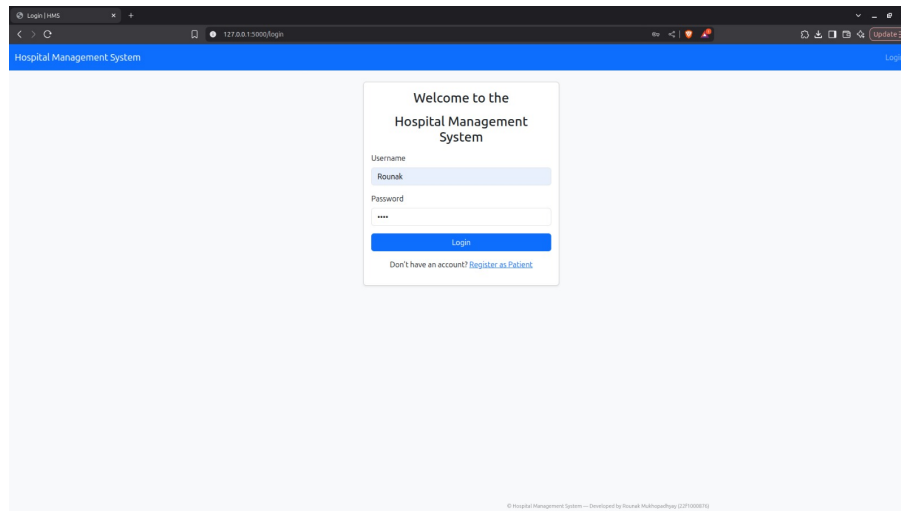

Figure 2: Unified login page used by Admin, Doctor, and Patient.

## 4.2 Patient Dashboard and Appointment Booking

Once logged in, patients are redirected to a dashboard showing all medical departments and doctor availability for the next 7 days (Figure 3). Patients can search doctors by specialization and book appointments through a guided date-time selection interface (Figure 4).

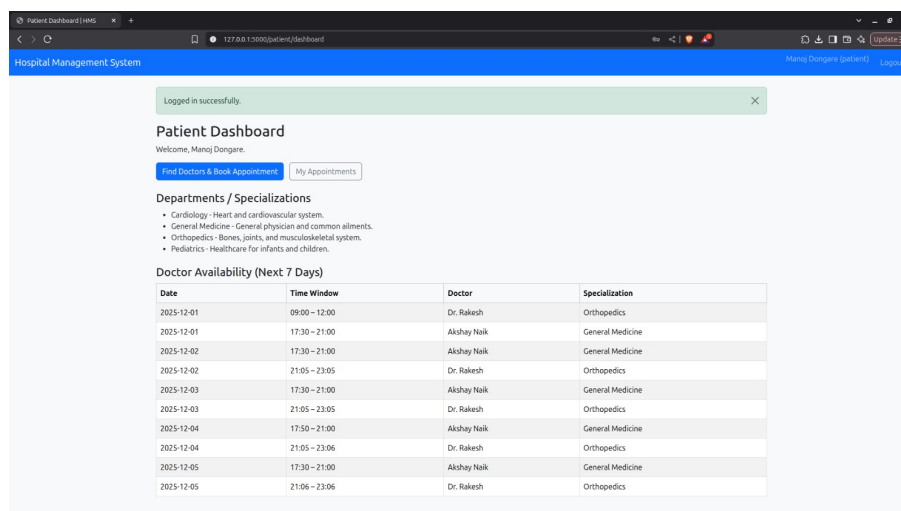

Figure 3: Patient dashboard displaying departments and weekly doctor availability.

## 4.3 Doctor Dashboard and Treatment Workflow

Doctors get a dedicated dashboard summarizing upcoming and completed appointments (Figure 5). For each completed visit, the doctor can open a treatment form to record diagnosis, prescription, and notes (Figure 6).

**Book Appointment**

Dr. Rakesh  
Specialization: Orthopedics  
Room: 221  
Contact: rakesh@gmail.com | 1234567890

**Availability (Next 7 Days)**

Date	Time Window
2025-12-01	09:00 – 12:00
2025-12-02	21:05 – 23:05
2025-12-03	21:05 – 23:05
2025-12-04	21:05 – 23:06
2025-12-05	21:06 – 23:06

Date: 02/12/2025 Time: 21:07

[Confirm Booking](#) [Cancel](#)

**Doctor Dashboard**

Welcome, Dr. Rakesh.

[View All Appointments](#) [Manage Availability](#)

Total Appointments: 8 Upcoming (Booked): 3 Completed: 4

**Next Appointments**

Date	Time	Patient	Contact	
2025-12-01	11:50	ROUNAK MUKHOPADHYAY	8697704443	<a href="#">Manage</a>
2025-12-02	21:07	ROUNAK MUKHOPADHYAY	8697704443	<a href="#">Manage</a>
2025-12-03	22:27	Manoj Dongare	7418529510	<a href="#">Manage</a>

Figure 5: Doctor dashboard showing total, upcoming, and completed appointments.

**Treatment Notes**

Patient: ROUNAK MUKHOPADHYAY  
Date & Time: 2025-12-01 at 11:50  
Status: Booked

**Diagnosis**  
Kidney Failure

**Prescription**  
Dialysis is recommended three times a week for the next 6 months.

**Doctor Notes**  
Follow-up after 1 month

[Save](#) [Back](#)

#### 4.4 Admin Dashboard and Hospital Operations

Admins can monitor and manage hospital operations from a centralized panel. The dashboard (Figure 7) shows total counts of doctors, patients, and appointments, along with a pie-chart visualization of appointment statuses. Admins can also view and filter all appointments through the dedicated panel (Figure 8).

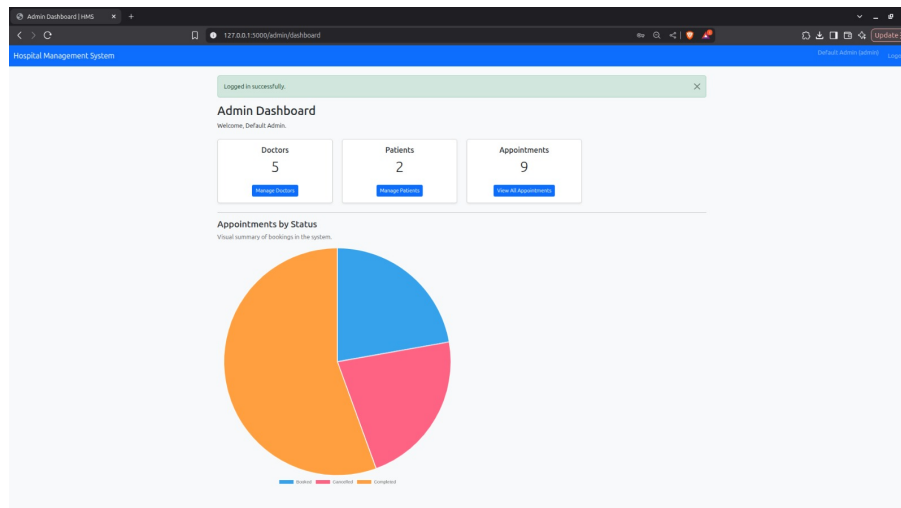

Figure 7: Admin dashboard with summary counts and appointment status visualization.

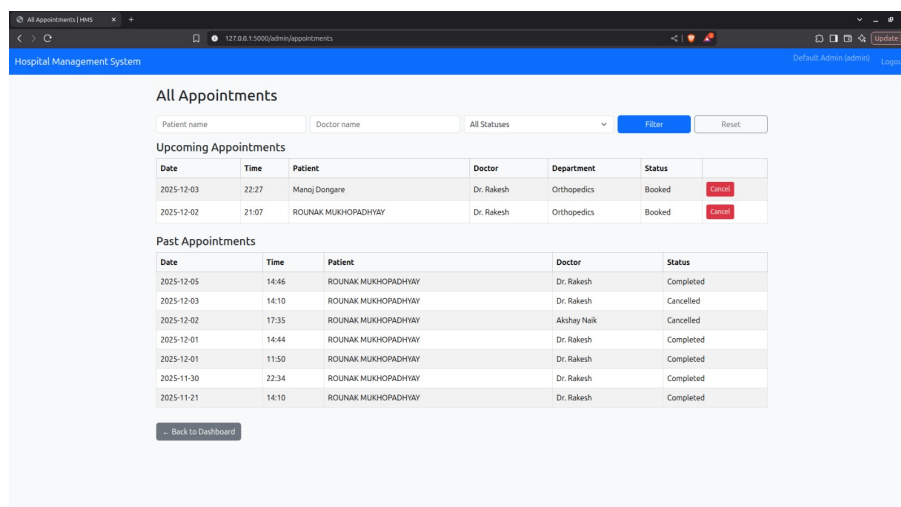

Figure 8: Admin view of all appointments with filtering by patient, doctor, and status.

## 5 AI / LLM Assistance Declaration

- ChatGPT was used only for brainstorming architecture ideas, extracting code templates, debugging, and drafting documentation.
- All code, logic, and UI implementation were manually written, tested, and modified by the student.
- AI assistance did not access or interact with private institutional data or user credentials.

## 6 Contribution Breakdown

Component / Task	Weight	Description
Flask Backend Development	25%	Routing, authentication, database communication
Admin Functionalities	15%	Manage doctors, patients, and appointments
Appointment & Availability Logic	20%	Slot validation and double-booking prevention
Treatment History Implementation	10%	Diagnosis, prescriptions, and notes per visit
Frontend (HTML/CSS/Jinja2)	20%	Interface design for all three roles
Analytics / API / Visualization	5%	Chart.js graph + <code>/api/stats</code> endpoint
AI Assistance	5%	Debugging and documentation support

## 7 Challenges Faced

- Implementing availability windows and validating appointment time boundaries.
- Ensuring the doctor cannot be double-booked via uniqueness constraints and business logic.
- Maintaining clean UI while supporting three distinct user flows with minimal code duplication.
- Keeping database schema simple yet extensible for future HMS expansion.

## 8 Conclusion and Future Scope

- A complete Hospital Management System was developed with role-based access and persistent treatment history.
- Future enhancements include laboratory report uploads, mobile app support, SMS/email reminders, and pharmacy/lab workflow modules.
